Course Description

This course introduces students to modern **causal inference methods** for analyzing data in economics and other social sciences. The goal is to help student develop a solid theoretical background in introductory level econometrics, the ability to implement modern techniques and to critique empirical studies in economics and other social sciences. Specifically, we will learn **six** modern econometric research design techniques that aim to credibly estimate causal effects:

- **Randomized Controlled Trial(RCT)**
- **Regression(OLS)**
- **Decomposition(WD)**
- **Instrumental Variables(IV)**
- **Regression Discontinuity Designs(RDD)**
- **Differences-in-Differences(DID)**

At the end, students mastering tools will use at least one of them to finish an empirical research project.
